

AI Usage Report

Course: Software for Mobile Devices

Assignment: Assignment 1 (Open-Ended AI-Assisted Application: AttendWise)

Student Name: Burhan Aslam

Registration No.: 23I-3097

Date: 03 October 2026

1. AI Tool(s) Used

List the AI tools used during the development of your application.

Example: ChatGPT, Gemini, GitHub Copilot

Response:

Claude (by Anthropic), used through the claude.ai chat interface (model shown: Claude Opus 5.5). No other AI tool was used.

2. Purpose of AI Usage

Explain what you used AI for during the development of your application.

Examples:

- Understanding React/React Native concepts
- Debugging errors
- Generating or improving UI ideas
- Implementing charts using react-native-chart-kit
- Understanding unfamiliar code
- Improving code structure

Response:

- Planning: turning the assignment into an app idea (AttendWise), a problem statement, the screens, the data model and the folder structure.
 - Setting up the Expo project: commands for creating a blank Expo project and installing react-native-svg and react-native-chart-kit.
 - Generating code: the data file, settings and theme, calculation and validation functions, 10 reusable components, the 3 screens and App.js.
 - Implementing the dashboard charts (Bar chart and Progress chart) with react-native-chart-kit.
 - Debugging setup errors: the Expo Go connection error, the SDK version mismatch and a typing mistake.
 - Understanding the code: line-by-line explanations of the functions, and a viva practice guide.
 - Documentation: the README and a first draft of this report.

-
-

3. Important Prompts Used

Provide the important prompts that you gave to the AI tool.

Prompt 1:

Opening prompt (shortened). I attached the assignment PDF and this report template and wrote: "You are my senior React Native mentor and pair-programmer. I am a university student working on a graded assignment. AI use is explicitly allowed by the assignment, but I will be questioned in a viva on every line I submit, and I must adapt the code live. So your job is to build the assignment WITH me and make sure I understand it, not just dump code." The prompt also listed honesty rules (do not assume, do not claim code was tested), the hard constraints (no navigation libraries, at least two chart types) and a 12-phase workflow.

Prompt 2:

After Expo Go showed "Project is incompatible with this version of Expo Go" (Expo Go was for SDK 57, the project used SDK 54), I sent the screenshot and wrote: "I got this error now tell me how to fix please".

Prompt 3:

When the instructions became too long and confusing, I asked: "please understand that now you have to make me exact steps I need to perform to get the assignment done no confusions no assumptions no bluff and tell me what we have to submit in the assignment ??". After this, the AI gave shorter numbered steps and a clear list of deliverables.

4. AI-Generated Output

Briefly describe the code, solution, or suggestion provided by the AI.

Response:

The AI suggested the app idea AttendWise, an attendance and marks tracker that tells students how many classes they can still miss, or must attend in a row to recover, before they become short. It produced:

- A plan: problem and solution statements, 3 screens (Dashboard, Courses, Add/Edit form), the course data model, a list of reusable components and the folder structure.
 - Setup commands for a blank Expo project, and later the upgrade to Expo SDK 57.
 - The code: settings.js and theme.js, initialCourses.js, utility files (calculations, advice, validation, search/filter/sort), 10 components, 3 screens and App.js, which switches screens with useState instead of a navigation library.
 - Three extra features: an "If you skip the next class" preview, an Undo bar for the last attendance tap, and Android back-button support.
 - Test checklists, a viva guide, the README and a draft of this report.
-

5. Changes Made by Me

Explain what you changed, modified, or improved in the AI-generated solution.

Response:

- The AI first set up the project for Expo SDK 54, assuming the store version of Expo Go supported it. My phone's Expo Go was SDK 57, so I upgraded the project with: `npx expo install expo@^57.0.0 --fix`.
- My phone could not connect to my laptop. I changed my Windows network and firewall settings so the phone could load the app
- While pasting the test code, a typing mistake (`<BarChartz\`) crashed the app. I found it using the VS Code Problems panel and corrected it to `<BarChart`.
- I took the screenshots, organised them in a screenshots folder and added my details to the README.

6. My Understanding

Explain the important part(s) of the AI-generated code in your **own words**.

Response:

The courses list is in the file app.js because there we have three screens: dashboard, courses, and form, and all three screens need the courses list so we can have it in app.js.

We have a state variable `silent screen` in the file app.js. In that we store only one name, like dashboard, courses, or form. We do have a condition with every screen.

The button is in the course card file but the data is in the app.js file. So that is why the card does not change itself. It tells [App.js](#) to update the attendance for a specific course.

7. Verification and Testing

Explain how you tested the AI-generated solution.

Mention:

- Whether the code worked correctly
- Errors encountered
- How you fixed the errors
- Any changes required after testing

Response:

I tested the app on a real Android phone using Expo Go, after every step.

Errors encountered and how they were fixed:

- A typing mistake (<BarChartz\)) in App.js crashed the app. I found it with the VS Code Problems panel and fixed it.
- Expo Go showed "Uncaught Error: java.io.IOException: Failed to download remote update". To find the cause, I opened the Metro address (<http://192.168.100.19:8081>) in my phone's browser and got "This site can't be reached", which showed that the phone could not reach the laptop. After changing my Windows network and firewall settings, the page loaded on the phone.
- Expo Go then showed "Project is incompatible with this version of Expo Go" (Expo Go for SDK 57, project on SDK 54). I upgraded the project to SDK 57, and the test chart then appeared.

Checking the code:

- Before building the screens, a temporary test screen printed the calculated values (for example, Database Systems at 72.2%, Short, needs 7 classes) and I checked that they matched the expected results.
- I went through a test checklist on the phone: marking attendance, editing a course, invalid form input (empty fields, duplicate code, credit hours above 4, attended more than held, marks above total), search with no results, filters and sorting, deleting all courses (empty states on both screens), a course with 0 classes, and the keyboard and back button. All tests passed.
- I also tested the three extra features (the skip preview, Undo and the back button) with 8 more checks, and all passed.

Change required after testing: in the first test chart, the y-axis started at 60% instead of 0%, which made the bars misleading. The final dashboard chart uses the fromZero setting so the bars start at 0%.

8. Reflection

What did you learn from using AI during this assignment?

Response:

I learned that AI is good tool till it is used for understanding what I did, we must leverage from the AI to accelerate our work but we must have to reconsider what code or what thing that is being produced.

Student Declaration

I confirm that I have used AI tools only as a development assistant and that I understand the code submitted as part of this assignment. I am able to explain and demonstrate the functionality of my application.
